Submitted (DEC-1998) to the PDB data_bank.

-I- FUNCTION: REMOVAL OF H(2)O(2), OXIDATION OF TOXIC REDUCTANTS,

BLOSYNTHESIS AND DEGRADATION OF LICHIN, DEFENSE RESPONSE TOWARD

WOUNDING AND METABOLISM OF AUXIN. THESE FUNCTIONS MIGHT BE

DEPENDENT ON EACH ISOZYME/ISOFORM IN EACH PLANT TISSUE.

-I- CATALYTIC ACTIVITY: Donor + H(2)O(2) = oxidized donor + 2 H(2)O.

-I- COPACTOR: Binds 1 protoheme IX, 1 iron(III) ion and 2 calcium io
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     X-RAY CRYSTALLOGRAPHY (2.15 ANGSTROMS).

THESE FUNCTIONS MIGHT BE DEPENDENT ON EACH ISOZYME/ISOFORM IN EACH PLANT TISSUE. CATALYTIC ACTIVITY: Donor + H(2)O(2) = oxidized donor + 2 H(2)O. COFACTOR: Binds 1 protoheme IX and 1 iron(III) ion.

TISSUE SPECIFICITY: ROOTS.

-!- FUNCTION: MAY PLAY A ROLE IN THE TEMPORAL AND SPATIAL REGULATION OF CHLOROPLAST DEVELOPMENT FROM PROPLASTID.
-!- DEVELOPMENTAL STACE: HIGHEST EXPRESSION OCCURS IN TWO-WEEK-OLD PLANTS AND DECLINES AS PLANTS DEVELOP FURTHER.
-!- SIMILARITY: CONTAINS 4 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zhang H., Scheirer D.C., Fowle W.H., Goodman H.M.; "Expression of antisense or sense RNA of an ankyrin repeat-containing gene blocks chloroplast differentiation in Arabidopsis.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

COPACTOR: Binds three manganese ions (By similarity). PATHWAY: Arginine biosynthesis.

PATHWAY: Pyrimidine biosynthesis; first step.

SUBUNIT: Composed of two chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used be the large (or ammonia) chain to synthesize carbamoyl phosphate (imiliarity).
                                                                                                                                                                                                                                                                                                                                                                LSANMEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     similarity).
SIMILARITY: BELONGS TO THE CARB FAMILY. C-TERMINAL SECTION.
CAUTION: Sequence of carB is split into two genes in M.jannaschii

J. Biol. Chem. 276:23161-23172(2001).

-I- FUNCTION: Transports one Ca(2+) and one K(+) in exchange for four Na(+) (By similarity).

Na(+) (By similarity) integral membrane protein.

-I- SUBCELLULAR LOCATION: Integral membrane protein.

-I- TISSUE SPECIFICITY: Abundant in the brain. Expressed at low levels in the aorta, uterus and intestine.

-I- SIMILARITY: BELONGS TO THE SLC24A FAMILY OF TRANSPORTERS.

Na(+) (By similarity).

SUBCELLULAR LOCATION: Integral membrane protein.

ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.

TISSUE SPECIFICITY: Abundant in the brain. Expressed at low levels in the aorta, uterus and intestine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: BELONGS TO THE SLC24A FAMILY OF TRANSPORTERS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (Human)

SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Abundant in the brain. Highest levels found in selected thalamic nuclei, hippocampal CA1 neurons and in layer IV of the cerebral cortex.
SIMILARITY: BELONGS TO THE SLC24A FAMILY OF TRANSPORTERS.
                                                                                                                                                      Similarity 7; Conser
